Overview

Shader Baker is a Unity Editor tool for baking textures from materials and creating frame-based animation output from shaders. It also includes a texture list merge utility for combining ordered texture layers into a single output.

Supported Use Cases

Bake a static texture from a material that uses a custom shader.

Bake an animation sequence from a shader over time.

Merge multiple texture lists into a layered output texture set.

Requirements

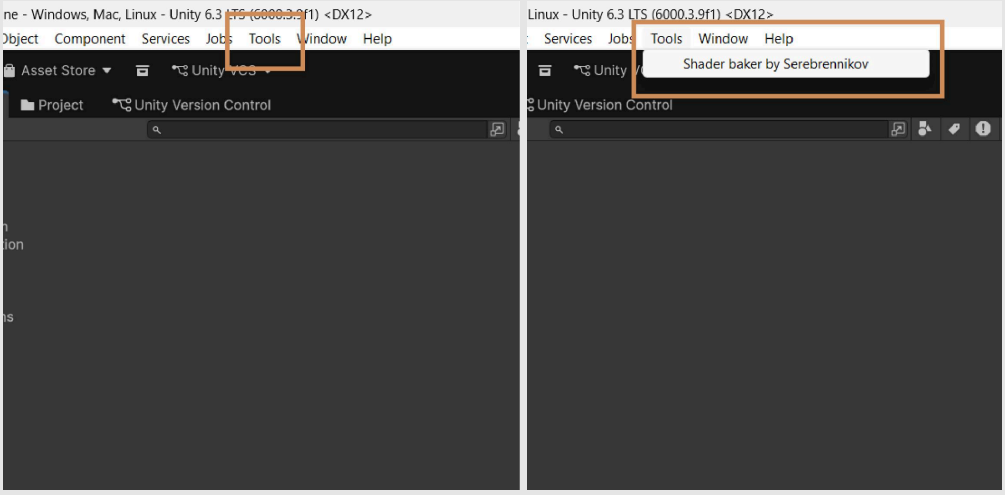
- Unity: 2021.3 LTS or newer
- Platform: Editor tool
- Render pipeline: URP
- For animation baking, the shader must expose parameters: "_BakeTime", "_Duration"

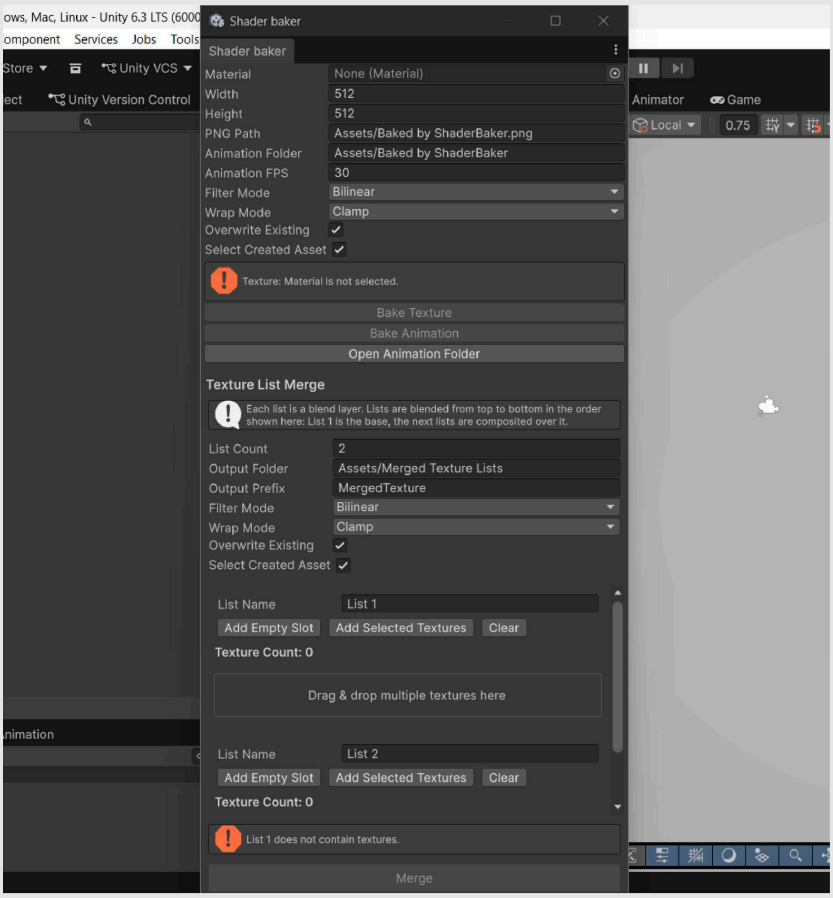
Installation

Import the asset into your project.

Get started

Open Tools > Shader Baker by Serebrennikov.



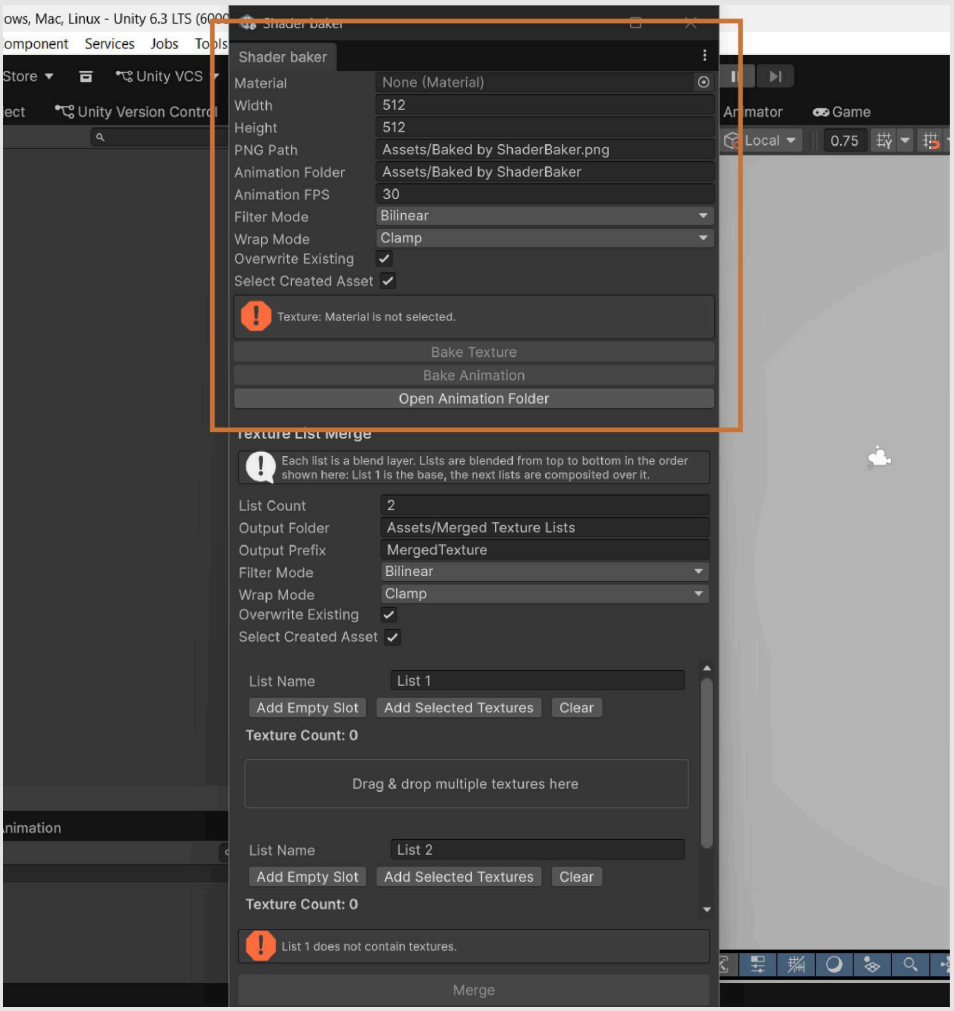


In this window, you can perform one of three tasks:

1. Create a texture from a material
2. Create a sequence of textures from a time-dependent shader on a material
3. Merge textures together

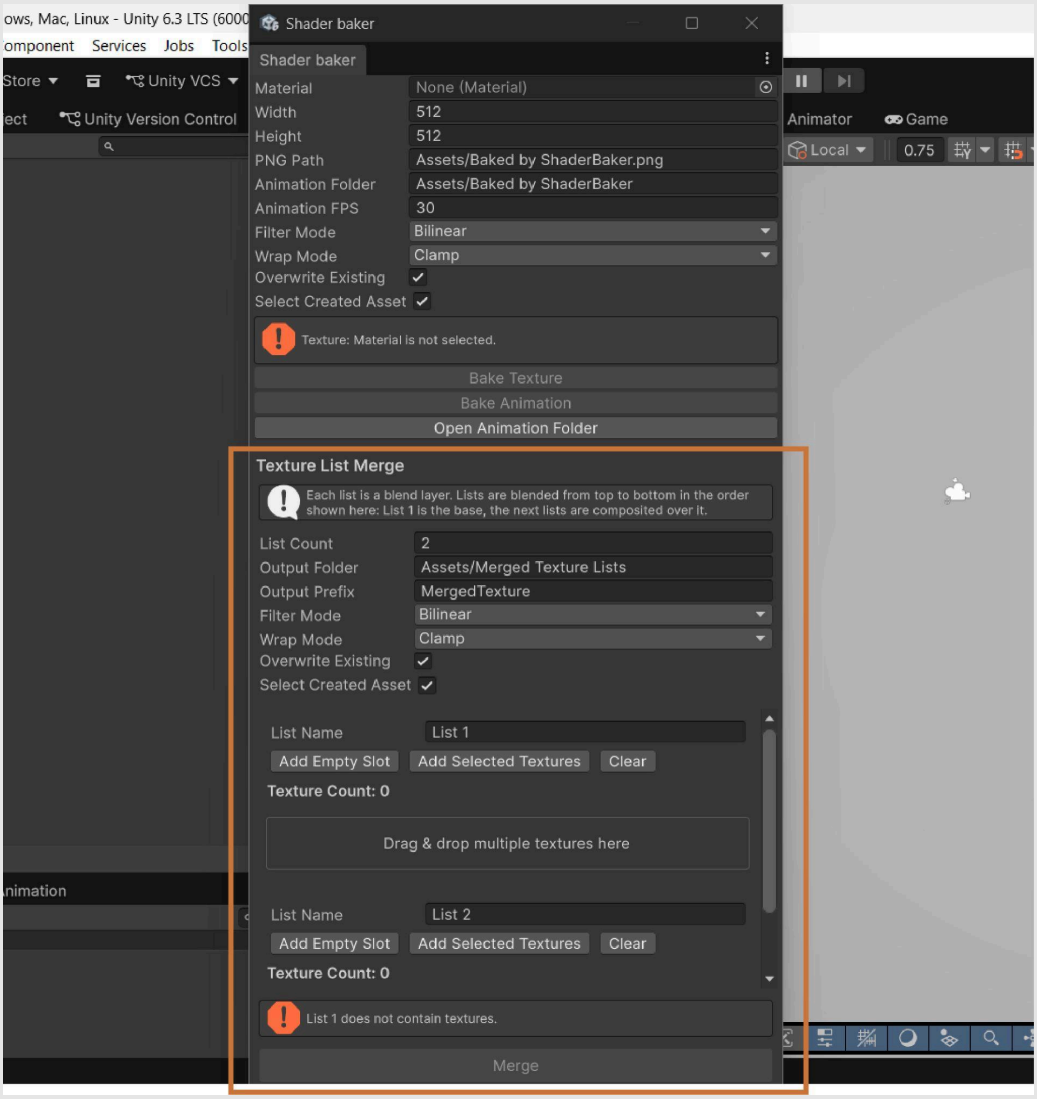
Creating a Texture from a Material:

1. Create a material
2. Assign a shader to the material
3. Drag the material asset into the “Material” field
4. Set width, height, and PNG output path
5. Click the “Bake Texture” button
6. The generated texture will be saved to the specified PNG path

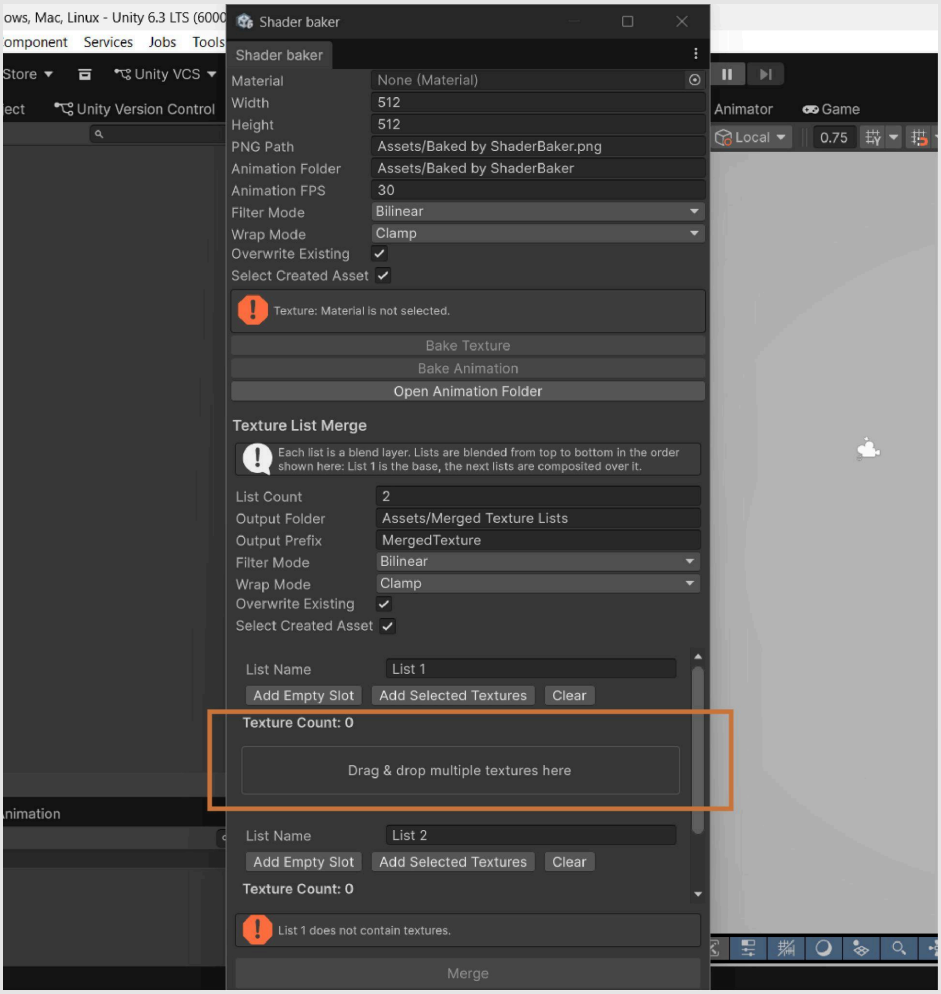


Creating an Animation Sequence from a Material

1. Create a material
2. Assign a shader to the material. The shader must include:
    a. _BakeTime (controls time progression during shader execution)
    b. _Duration (total duration of the shader, static value)
3. Drag the material asset into the “Material” field
4. Set width, height, animation folder, and "Animation FPS"
5. Click the “Bake Animation” button
6. A folder will be created at the specified path containing the generated textures
    a. Merging Texture Lists:



1. Set “List Count” to the number of texture lists to merge
    a. Example: if you have 15 textures from one animation and 15 from another and want to merge them, set it to 2. Frames will be merged by matching indices
    b.
2. Optionally configure additional parameters below
3. Select texture lists in the Project window and drag them into the “Drag & drop multiple textures here” field



4. The textures will appear above the field once loaded
5. Repeat for additional lists depending on your List Count
6. Click the “Merge” button
7. The textures will be processed and saved to the specified Output folder
